

WHO ARE WE, OUR ACTIVITIES

Turbotect Limited, a Swiss company founded in 1978, provides services and specialty products to the power generation market.

In the USA and Russia, Turbotect (USA) Inc. and Turbotect St. Petersburg Ltd. were formed to serve the North American, respectively the Russian gas turbine and petrochemical markets.

Turbotect products are recognized and endorsed by most of the major gas turbine manufacturers and comply with industry standards and specifications.

Turbotect fuel treatment products include a wide range of fuel additives to control high temperature corrosion and ash deposits in gas turbines firing residual oil, crude oil or contaminated distillate.

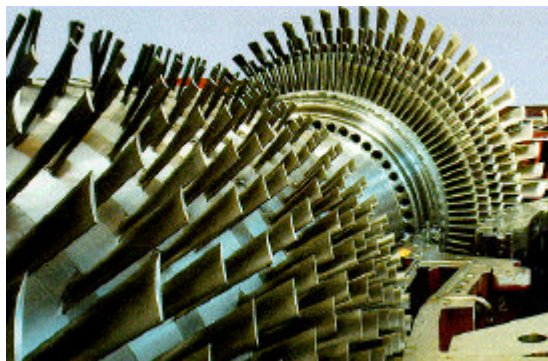

Also fuel additives reducing the risk of high temperature corrosion, caused by contamination entering the gas turbines via the compressor inlet air, and from water and steam that may be injected for NOx abatement, are offered by Turbotect.

Other important gas turbine fuel treatment products include combustion improvement additives to reduce smoke and particulate emissions; lubricity improvement additives for applications involving naphtha, kerosene, gas condensates and other light distillate fuels; demulsifiers and dehazers for improved water separation in gas turbine fuel treatment; biocides and slime prevention formulations.

Turbotect compressor cleaning products include water-based and solvent-based detergents for ON LINE and OFF LINE wet cleaning applications, non-hazardous anti-icing agents for cold weather compressor cleaning, nozzle injection systems, stationary wash skids and mobile wash carts.

A further business area of Turbotect is consulting services and on-site training in metallurgical aspects of gas turbine technology.

The services are clearly designed to enable power plant operators to minimize operation and maintenance costs by considering various aspects of component life cycle engineering.
